For simplifying 3-variable functions

binary translation

0	0000
1	0001
2	0010
3	0011
4	0100
5	0101
6	0110
7	0111
8	1000
9	1001
10	1010
11	1011
12	1100
13	1101
14	1110
15	1111

ex. Suppose we have  $\Sigma(5,7)$  shown above.  
 $5 = 101$   
 $7 = 111$  } what do they have in common?  
 $x=1$  and  $z=1$ , so the term is  $xz$ .

For simplifying 4-variable functions

ex. Suppose we have  $\Sigma(8,9,12,13)$   
 $8 = 1000$   
 $9 = 1001$   
 $12 = 1100$   
 $13 = 1101$  } what do these have in common?  
 $w=1$  and  $y=0$ , so the term is  $wy'$ .

Note that in general there may be several terms to examine.
